

9) T3 Consider a random walk over the non-negative integers with the following transition probabilities:
 $P_{01} = 1, P_{i,i+1} = p, P_{i,i-1} = q, i > 0$, with $p + q = 1$. Study its behavior, and in particular characterize its recurrence or transiency and derive the steady-state distribution.

$$P = \begin{matrix} & \begin{matrix} 0 & 1 & 2 & \dots \end{matrix} \\ \begin{matrix} 0 \\ 1 \\ 2 \\ \vdots \end{matrix} & \begin{pmatrix} 0 & 1 & 0 & 0 & 0 & \dots \\ 1-p & 0 & p & 0 & 0 & \dots \\ 0 & 1-p & 0 & p & 0 & \dots \\ \vdots & \vdots & \vdots & \vdots & \ddots & \end{pmatrix} \end{matrix}$$

To derive steady state distrib. we need to solve

$$X_i = \sum_{j=0}^{+\infty} X_j P_{ji} = p X_{i-1} + q X_{i+1}$$

where $\sum_{k=0}^{\infty} X_k = 1$. ②

Firstly

$$X_0 = q X_1 \quad X_1 = \frac{X_0}{q}$$

$$X_1 = X_0 + q X_2 \quad X_2 = \frac{X_1 - X_0}{q} = \frac{X_0 - q X_0}{q^2} = \frac{(1-q)X_0}{q^2} = \frac{p X_0}{q^2}$$

$$\Rightarrow \text{Generally, } X_i = \frac{1}{p} \left(\frac{p}{q}\right)^i X_0$$

So using ②

$$1 = \sum_k X_k = \frac{1}{p} X_0 \sum_k \left(\frac{p}{q}\right)^k \Rightarrow X_0 = \frac{p}{\sum_k \left(\frac{p}{q}\right)^k} \quad \text{③}$$

\Rightarrow From ③ we can conclude that

- If $p < q$, sum converges so chain is positive recurrent
- If $p \geq q$, sum diverges so chain is transient

11) T2 For a Poisson process $X(t)$ of rate λ , state and derive the expression of $P[X(u) = k | X(t) = n]$ for the two cases (i) $0 < u < t, 0 \leq k \leq n$ and (ii) $0 < t < u, 0 \leq n \leq k$.

Binomial Theorem

i) $0 < u < t, 0 \leq k \leq n$

$$\begin{aligned} &= \frac{P[X(u)=k, X(t)=n]}{P[X(t)=n]} = \\ &= \frac{P[X(u)=k, X(t)-X(u)=n-k]}{P[X(t)=n]} = \\ &= \frac{\left(e^{-\lambda u} \frac{(\lambda u)^k}{k!} \right) \left(e^{-\lambda(t-u)} \frac{(\lambda(t-u))^{n-k}}{(n-k)!} \right)}{e^{-\lambda t} \frac{(\lambda t)^n}{n!}} = \end{aligned}$$

$$= \binom{n}{k} \frac{u^k}{t^n} \frac{(t-u)^{n-k}}{t^{n-k}} = \binom{n}{k} \left(\frac{u}{t}\right)^k \left(1 - \frac{u}{t}\right)^{n-k}$$

ii) $0 < t < u, 0 \leq n \leq k$

$$\begin{aligned} &= \frac{P[X(u)=k, X(t)=n]}{P[X(t)=n]} = \\ &= \frac{P[X(t)=n, X(u)-X(t)=k-n]}{P[X(t)=n]} \quad \begin{matrix} \text{a} & \text{b} \end{matrix} \\ &= \frac{P[\text{a}] P[\text{b}]}{P[X(t)=n]} \quad \begin{matrix} \downarrow \\ \text{disjoint intervals} \\ \Rightarrow \text{independent} \end{matrix} \\ &= P[X(u-t)=k-n] \quad \begin{matrix} \swarrow \\ \text{stationary increments} \end{matrix} \\ &= e^{-\lambda(u-t)} \frac{(\lambda(u-t))^{k-n}}{(k-n)!} \end{aligned}$$

T3 For a renewal process, state precisely (also providing a formal proof) what is the value of

$$\lim_{t \rightarrow \infty} \frac{N(t)}{t} = \frac{1}{\mu}$$

$$\lim_{t \rightarrow \infty} \frac{N(t)}{t} = \frac{1}{\mu} \quad \text{w.p. 1}$$

Proof:

$$S_{N(t)} \leq t < S_{N(t)+1}$$

$$\frac{S_{N(t)}}{N(t)} \leq \frac{t}{N(t)} < \frac{S_{N(t)+1}}{N(t)}$$

$$\lim_{t \rightarrow \infty} \frac{S_{N(t)}}{N(t)} = \lim_{n \rightarrow \infty} \frac{S_n}{n} = \mu \quad \text{w.p. 1}$$

\downarrow LLN $\quad \downarrow$ LLN

$N(t) \rightarrow \infty$ as $t \rightarrow \infty$

$$\lim_{t \rightarrow \infty} \frac{S_{N(t)+1}}{N(t)} = \frac{S_{N(t)+1}}{N(t)+1} \cdot \frac{N(t)+1}{N(t)} = \mu \cdot 1 \quad \text{w.p. 1}$$

\downarrow μ $\quad \downarrow$ 1 $\quad \downarrow$ LLN

$$\Rightarrow \mu \leq \lim_{t \rightarrow \infty} \frac{t}{N(t)} \leq \mu \quad \text{w.p. 1}$$
